Sales Order Manager

Create and Process Sales Orders with Ease and Efficiency

Sales Order Manager (SOM) module allows an order to be entered at the start of the process and flows the information to multiple destinations, including weigh scales, the scan/pack stations to collate a load, and to the warehouse to pick a load.

The tool integrates systems such as third party accounting or export documentation software and other Triton modules to streamline sales order processing, and reduces errors made by late changes to orders and duplicated manual entries.

Designed for the food processing industry, SOM is able to record and invoice based on dozens of fields beyond quantity and count, including serial number, date range, batch identification, etc.

- ✓ Holds complete customer sales and price history
- ✓ Reports customer and product margins, inventory position valuation, Stock on Hand, & Stock Available
- ✓ Enables load outs to be scanned to specific order targets

Stock Scan

Supports Easier, More Accurate Fulfillment of Customer Orders

Stock Scan helps dispatch teams improve service levels, prevent mistakes in rotation and shelf life management, and minimise losses. It operates like a spreadsheet ledger with opening balances, movements inward and outward, and current balance.

Scanners automatically update the movement of stock to provide a self-managed solution, making the order processing and dispatch cycle more visible, accessible and easier to manipulate. This results in accurate dispatch against orders, less internal waste and reduced delivery claims.

- ✓ Customised ledger view can include plant, store, location, cartons, weight, dates, and pallets
- ✓ Provides age warnings
- ✓ Load and inventory reports with production date drill through

Sales & Inventory

Manages single and multi site inventory specifically for the food industry. Sales integration allows ease and efficiency in the creation and processing of sales orders throughout all departments and eliminates data entry duplication.

Sales Order Manager

Sales & Inventory modules work as a stand alone solution or can connect seamlessly to FUSION for Processing Intelligence

FUSION
Processing Intelligence

FUSION is Triton's central management platform that has been designed from the ground up to fuse processing software modules and data together. Food Processors face challenges from a variety of sources such as the need to combine data from multiple parts of operations, requirements for end to end traceability, multiple site integration, offsite storage, big data analysis and much more. FUSION was borne to solve these needs and more. FUSION provides a single point of access and control to software systems and brings together multiple software modules from a single site, to multiple sites, into one easy accessible platform.

FUSION supports many centralised, distributed control functions (e.g. specifications, orders, group inventory and production, and more) in a modern, accessible platform that communicates to distributed plant production systems. FUSION also provides carton accurate traceability and smart logic actions for contamination or defect issues during the production process. Utilising the latest web technology (HTML5), FUSION is accessible enterprise wide from production plants, other company offices, or offsite, and from workstations, tablets or smartphones.

FUSION makes data more accessible and presented smarter in customised, graphical forms that provide advanced, real time business intelligence. Our clients and their managers need real-time information at their finger-tips, on their smartphones, or on the plant floor, to remain in touch with what's going on in their business. They also require a flexible platform that allows customisable and unique presentation of data, specific to their needs. These are all FUSION's greatest strengths.

With simple, accessible licensing options, FUSION is readily accessible for single site operators, through to large multi site enterprise customers.
